Erik Gonzalez

CSe 020 Lab

Part 2

1. I encountered many different types of errors including: repeated variables, incorrect data types used in the wrong places, entire statements being repeated, and outputting the wrong values.

2. My strategy is to go from line to line and see if I notice any repeating variables, after that I go to run the program and if it fails I go to the line it failed to, I then rinse and repeat till I go from line to line, fixing any error I see.
